Connected Vehicle Pilot Deployment Program Request for Information (RFI) Update

Kate Hartman
USDOT Intelligent Transportation Systems Program Manager, CV Pilot Deployment Program
On March 12, 2014, the United States Department of Transportation (USDOT) released a Request for Information (RFI) on the Federal Register for the Connected Vehicle Pilot Deployment Program.

- Input will be used to help refine plans for one or more pilot deployments.
- Pilot Deployments are expected to combine connected vehicle and mobile device technologies innovations to improve traveler mobility and system productivity, while reducing environmental impacts and enhancing safety.
- The Federal Highway Administration (FHWA) anticipates a procurement action for one or more pilot model deployment concepts in 2015.
- The due date for responses was April 11, 2014.
Connected Vehicle Pilot RFI Responses

The USDOT received 63 responses to the RFI

Summary of Responses to RFI Questions

Proposed Time Frame

**Question 1:** The DOT envisions an initial wave of pilot deployments to be awarded and commence in 2015. Additional waves may follow this first wave, through 2017. After a 12-18-month planning and deployment phase for each selected pilot site, a period of pilot operational testing and data collection is expected. The operational period, results analysis, and publication of final results are anticipated to occur over a period that does not exceed 18 months. Is this schedule too cautious, too ambitious, or about right?

- Most responders agreed that a 12-18 month planning and deployment phase for each selected pilot site (72%), and an 18 month operation, analysis, and publication of final results (66%) are reasonable.
- Eight responders recommended allowing more planning and deployment time.
- Nine responders recommended allowing more operation, analysis, and publication time.
- Few responders thought the schedule was too cautious based on their experiences or the expectation.
Question 2: Is it feasible to achieve the goals of the program with multiple deployment sites? What is the rough order of magnitude of resources (e.g., cost, vehicles, roadside installations, devices, or size of geographic area) expected to enable a meaningful pilot deployment in a single site? What is an appropriate Federal/site cost share split?

- The majority of responders agreed that consideration should be given to multiple deployment sites.
- Only one responder recommended against multiple deployments citing potential limitations to resources.
- Some responders believe that multiple deployment sites should provide a wide diversity of applications, locations (including urban, suburban, and rural), weather, topological variations, products, jurisdictions, and road types.
- Rough order of magnitude costs for pilot deployments ranged from $1 million to $100 million.
- Most public agencies recommended 80/20 or 90/10 cost share split and also recommended including soft match.
- Some private sector firms and the academic/research community recommended 50/50 cost share split.
Summary of Responses to RFI Questions

Data Sharing

**Question 3:** The DOT intends to provide open appropriate access to the data collected as part of this effort through the Real-Time Data Capture and Management Program. Appropriate access includes suitable protections regarding data ownership, intellectual property rights, and privacy.

a. Do you see value in broadly sharing the data with other researchers?

b. Will such data sharing inhibit participation in the pilot deployment program? If so, what mitigation actions will encourage participation?

c. How should the Research Data Exchange be used in support of the pilot deployments? Should data be uploaded as the deployments are being conducted (i.e., real-time feeds) or as daily archives?

- a. Nearly all responders **stated that there is value in sharing the data with other researchers.**

- b. **All of the broad classes of respondents agreed that data sharing is good and will not be an impediment to participation** provided that:
  - PII is removed; Intellectual Property (IP) is protected
  - Proprietary and commercial data is removed;
  - The data sharing agreement is not too onerous; and
  - Research partners are connected with the data.

- c. **Responses on the topic of daily uploads vs. real-time were mixed.**
Summary of Responses to RFI Questions
Open Source Development

**Question 4:** The DOT has identified an open source approach as a method to ensure sharing of Government-funded research products and shorten the time lag between research and deployment.

a. Do you see value in making algorithms and application source code funded by this pilot deployment program broadly available?

b. Will such an open source approach inhibit participation in the pilot deployment effort? If so, what mitigation actions will encourage participation?

c. Should any particular type of application be provided in open source format (e.g., safety applications, non-safety applications, or mobility applications)?

d. The DOT seeks to encourage commercially developed applications based on these pilot deployments. What other avenues do you see for rapid commercialization besides an open source approach?

- a. 71% of the responders agreed with the approach as a whole; 18% responders agreed with the approach, but with reservations mostly having to do with IP rights and if the funding is government based; and 11% disagreed with the approach all together.

- b. Many of responders think that **if IP rights can be protected** this would encourage private companies to participate.
c. Which Apps?

- Some responders believed that any application funded by the program should be Open Source.
- There were **mixed responses about the Safety Applications** with some responders believing they should **NOT** be open source because of security and other respondents believing they should be open source to foster research activities.
- Many responders believe **security applications should not be Open Source**, but **one agency strongly believed** they should be Open Source to avoid ‘security through obscurity’ problems.

d. Path to Commercialization?

- Many responders suggested the **fastest way to commercialization** is to have real-world pilot sites **up and running** to demonstrate the technology, benefits, and cost of the pilots.
- A few responders suggested **public/private partnerships as another method to faster commercialization** with fund sharing.
Summary of Responses to RFI Questions
CV Reference Implementation Architecture

**Question 5:** The DOT wants to use these pilot deployments to support early implementation of connected vehicle technology. Connected vehicle technology needs to be interoperable and, as a result, requires consistency across implementations. What is the role of the Connected Vehicle Reference Implementation Architecture?

- There was **general consensus** from responders that the CVRIA is a useful tool for **identifying the key interfaces across the connected vehicle environment** which will support further analysis to **identify and prioritize standards development** activities and support a national deployment of connected vehicle technologies.
- Several responders **strongly encouraged** the use of the CVRIA to **support planning activities** for the CV Pilots.
- **Public agencies** saw the potential for the CVRIA to support replication of work already done by the USDOT.
- Some private sector responders believed the architecture should define the interfaces to the vehicle via communication technologies and other back-end data exchange requirements, but **should not provide any in-vehicle architecture requirements.**
Summary of Responses to RFI Questions

Early V2V Applications

**Question 6:** How should the pilot programs be used to support early implementation of technologies enabling vehicle-to-vehicle applications?

- Many public agencies recommended that the pilots use public vehicle fleets (maintenance, emergency response, transit) possibly equipped with aftermarket devices, and involve commercial vehicles to accelerate deployment of V2V applications.

- Several public agencies, researchers and private sector firms emphasized the importance of working in partnership with vehicle manufacturers through consortia such as CAMP.

- Public agencies and academic researchers commented on the challenges of developing and testing the security certificate management system, ensuring interoperability of the applications, and concerns about developing common standards and architecture.

- Several of the private sector firms stated that testing and validation of the V2V applications should be the primary purpose of the pilots.
Summary of Responses to RFI Questions
Affiliated Test Beds

**Question 7:** The DOT has invested in connected test bed development. What role should the affiliated connected vehicle test beds play in preparing or conducting pilot deployments?

- Some of the responders expressed their views on whether the applicants proposing pilots should be required to obtain affiliated connected vehicle test bed status or work with an existing test bed (affiliated or otherwise).
  - Five responders were opposed to requiring affiliated status.
  - Eleven responders supported the idea of the pilots expanding upon or working with an existing test bed.

- Some responders suggested other possible uses of the test beds:
  - Conducting **simulations before deploying** a full pilot;
  - Continuing testing and validating of standards;
  - Testing of alternative architectures;
  - Researching connected vehicle **applications for vulnerable road users**;
  - Conducting research into technologies such as **vehicle automation, transportation cybersecurity, and “big data” for transportation**; and
  - Forming the basis for a **peer exchange or lessons learned program**.
Summary of Responses to RFI Questions

AASHTO Footprint Analysis

**Question 8:** The American Association of State Highway and Transportation Officials has prepared a connected vehicle footprint analysis. To what extent can deployment scenarios identified in that analysis be achieved as a part of a pilot deployment?

- Many responders believed that using the AASHTO analysis would be a good starting point for developing or selecting pilot deployments.
- Several respondents felt the AASHTO analysis might be too much to cover in the pilot deployments, but a diverse set of pilots covering as wide a range of the deployment scenarios as possible is recommended.
  - Some responders stated that a pilot deployment should not cover all applications, but focus on the most valuable “low hanging fruit”.
  - Some responders stated that the value of the applications should be determined by the benefit to the real-world needs of the community.
- Public agencies responded favorably to the AASHTO analysis, but some agencies remarked that it focused primarily on DSRC applications.
- Some private sector firms stated that the lessons learned from the pilot deployments should be used to improve the AASHTO guidance.
Summary of Responses to RFI Questions
Performance Measurement and Teaming

**Question 9:** How can the potential value of connected vehicle applications best be measured and estimated in concert with pilot deployment activities?

- All responders supported the use of performance measurements in pilot deployment activities, but suggest a broad range of criteria and/or methods.
- Some responders stated that they support a ‘before and after’ study.

**Question 10:** Based on the nature of the pilot deployments, DOT believes that a multimodal cooperative effort involving private and public sector organizations will be required. Feedback is requested on issues including the challenges in forming the teams as a lead organization, a partner, or another participant. What forms or demonstrations of commitment by the participants are reasonable and appropriate requirements of respondents to a solicitation for the pilot deployment program (e.g. letters of intent, proposed matching requirements, or draft project plans)?

- All responders indicated support for multi-modal cooperative teams involving public, private, and civic organizations with emphasis on public-private partnerships.
Key Takeaways

- The responses were overwhelmingly positive with regard to the idea of having CV Pilot Deployments.
- The idea of having multiple sites was broadly supported.
- There do not seem to be any major red flags, although there needs to be a nuanced approach around key issues such as data sharing, privacy, and IP protection.
- The time frame for the pilots was considered to be generally practicable, although some respondents felt the time frame might be too ambitious.
- Security and credential management was brought up in several responses, although the RFI did not specifically ask a question about it.
- The costs estimated range wildly, from as little as $1M to $100M.
- There appears to be a split between respondents who think of the CV Pilots as primarily non-DSRC and mobility/environmentally related, and those who consider the CV Pilots to be heavily DSRC-dependent and safety-focused.
